Goal

Group _____ System _____

Pick **one** non-functional requirement that matters for your system and write it as a GQM goal. Be specific: a goal you can't measure yet is fine, a goal nobody cares about is not.

Our system in one sentence

Quality focus circle one

Performance · Availability · Scalability · Modifiability · Security · Usability · Deployability · Operating cost · Other:

Fill in the goal template

Analyse object	Which system, component, interface or process?
for the purpose of purpose	characterise · evaluate · predict · improve · control
with respect to quality focus	The NFR, narrowed down (e.g. "response time of checkout", not just "performance")
from the viewpoint of stakeholder	end user · operator · developer · product owner · …
in the context of situation	load, phase, team, environment: when does this goal apply?

Why it matters what decision would the answer change?

What does "good enough" look like? a target, if you have one

Questions

Group _____

What do you need to know to decide whether the goal is met? Write questions first; don't think about data yet. Then rate how much each answer would tell you about the goal.

B · Baseline
What is it like now? *"What is p95 response time at peak?"*

C · Cause
What affects it? *"Where in the call chain is time spent?"*

E · Evaluation
Did it get better, or meet the target? *"Is p95 under 800 ms after the change?"*

#	Question	Kind B · C · E	Value circle	Keep?
ex.	*Where is the time spent in a slow order request?*	*C*	***H***	✓
Q1		B · C · E	H · M · L	
Q2		B · C · E	H · M · L	
Q3		B · C · E	H · M · L	
Q4		B · C · E	H · M · L	
Q5		B · C · E	H · M · L	
Q6		B · C · E	H · M · L	
Q7		B · C · E	H · M · L	
Q8		B · C · E	H · M · L	

H · High value
The answer alone tells you a lot about whether the goal is met.

M · Medium value
Useful, but only together with other answers.

Test each question
If the answer surprised you, would anyone do something differently? If not, drop it.

Metrics and data

Group _____

For each kept question, name the data that would answer it. A question may need several metrics, and one metric may serve several questions. Now is the time to ask: do we already have this?

Q#	M#	**Metric** what exactly, in which unit	**Source** tool, log, person	**Data** have · collect	**Cost** circle	**Type** obj · subj
ex.	M1	*Database query time per request (ms)*	*Slow-query log*	*have*	***L***	*obj*
	M1			have · collect	L · M · H	obj · subj
	M2			have · collect	L · M · H	obj · subj
	M3			have · collect	L · M · H	obj · subj
	M4			have · collect	L · M · H	obj · subj
	M5			have · collect	L · M · H	obj · subj
	M6			have · collect	L · M · H	obj · subj
	M7			have · collect	L · M · H	obj · subj
	M8			have · collect	L · M · H	obj · subj

L · Low cost
The data exists. Someone just has to query or export it.

M · Medium cost
Needs a config change, a script, or a short manual count (hours to a few days).

H · High cost
New instrumentation, a survey, an experiment, or weeks of collecting before you have an answer.

Select

Group _____

Place each question–metric pair (e.g. **Q2–M1**) on the grid, using the question's value from sheet 2 and the metric's cost from sheet 3. Start from the top-left corner.

Our picks	Question and metric	We expect hypothesis, before measuring
1		
2		
3		

One costly metric worth paying for, and why

Who looks at the answer, and what will they do with it?
